SUMMARY

Software Engineer with 5+ years of experience building distributed systems and data pipelines. Currently own Agoda's global analytics platform, which handles around 4 billion events a day across 190+ countries. I like working close to the data, designing systems, and making sure what ships is fast, reliable, and compliant.

WORK EXPERIENCE

Senior Software Engineer · Agoda

Bangkok, Thailand | Jan 2023 – Present

Analytics Platform & Data Infrastructure

- Own the global analytics platform at Agoda — it ingests around 4B+ events a day from web, mobile, and server, and serves product, marketing, and data science teams in 190+ countries
- Designed and built a real-time anomaly detection system that catches data quality issues within minutes instead of hours. Brought mean-time-to-detect down by about 60%.
- Built an analytics testing framework from scratch. It's cut production bugs in analytics by 15% and turned regression investigations that used to take days into something that takes a few hours.
- Built an ETL pipeline that calculates user engagement metrics like drop-off rate, funnel conversion, and session retention directly from raw event data, so product teams can pull these numbers themselves instead of filing a request.

Observability, Reliability & Cross-team Collaboration

- Built a monitoring and alerting dashboard for the pipeline so we catch anomalies before they hit customers, helped cut critical incident response time by around 40%.
- Collaborate with the WebView team to extend analytics coverage across the WebView–native bridge, so event tracking stays consistent even on hybrid surfaces.
- Migrating a team onto the analytics platform used to mean a lot of manual back-and-forth, so I built tooling to automate most of it. It's now the standard way any team at Agoda onboards.
- Worked with Legal and Compliance to build real-time PII detection and masking into the pipeline. We're fully GDPR/PDPA compliant now and have passed every audit since.

Senior Software Engineer · Enosis Solutions

Dhaka, Bangladesh | Jan 2022 – Dec 2022

- Led a small team of two rebuilding a legacy Perl work order system in .NET. We hit the deadline, kept zero data loss, and downtime dropped noticeably after launch.
- Designed the new .NET service architecture with clean separation of concerns, which made it much safer to ship new features without breaking existing workflows.

Software Engineer · Enosis Solutions

Dhaka, Bangladesh | Mar 2019 – Dec 2021

- Integrated our core product with Oracle, SAP, and DELTEK so data could flow across enterprise systems — this ended up unblocking several new client onboardings that were stuck waiting on it.
- Built a queuing system for data sync that replaced a flaky nightly batch job. Sync speed and reliability improved by about 50%, and it stopped needing someone to babysit it.

EDUCATION

B.Sc. Computer Science and Engineering — Military Institute of Science and Technology (MIST), Dhaka Feb 2015 – Mar 2019

TECHNICAL SKILLS

Languages: Java, C#, JavaScript / TypeScript, Python, C/C++, SQL

Backend & Frameworks: Java Spring, .NET Core, .NET, Node Express, Django

Data & Streaming: Apache Kafka, Apache Hadoop, Redis, Apache Spark, SQL/NoSQL

Cloud & Infra: Docker, Kubernetes, GitHub Actions, Gitlab CI/CD

Frontend: React

Domains: Distributed Systems, Data Pipelines, ETL, Observability, System Design

COMPETITIVE PROGRAMMING

LeetCode Top 9% globally | Codeforces Expert (max rating 1686)
